

Adding It All Up: Professional Services Rethinks Sharing Data with Service Providers

As nefarious characters become more sophisticated in their approach, they become increasingly harder to spot. Nearly half (41%) of professional services surveyed are more likely to say that sharing data with third parties is seen as a significant information security risk. With this in mind, professional services must create a security-minded corporate culture to strengthen their first line of defense against data breaches—their employees and service providers.
